

Potential Field Path Planner

This project implements a 3D potential field path planner for robotics applications. The planner navigates a robot from a start position to a goal position while avoiding obstacles using attractive and repulsive forces. This project showcases my engineering and programming skills and reflects my passion for robotics and learning.

Purpose

The purpose of this project is to develop a potential field path planner that can efficiently navigate a robot in a 3D environment. The planner uses mathematical concepts to generate a path from a start position to a goal position while avoiding obstacles. This project is a learning exercise in robotics, path planning, and optimization.

Features

- **Attractive Force:** Guides the robot towards the goal.
- **Repulsive Force:** Keeps the robot away from obstacles.
- **Path Planning:** Generates a path from start to goal while avoiding obstacles.
- **Visualization:** 3D visualization of the path and obstacles.
- **Parameter Optimization:** Finds the best attractive and repulsive gains for the planner.

Screenshot

The following is the result of the potential field path planner navigating an agent from a start position to a goal position while avoiding obstacles.

Please excuse the fact that the path is obscured by the obstacles in the saved visualization. If I have time, I will fix this issue.

Installation

Ensure you have Python and the required libraries installed:

```
pip install numpy matplotlib
```

Usage

Example Code

```
import numpy as np
import matplotlib.pyplot as plt
from mpl_toolkits.mplot3d import Axes3D
from matplotlib.animation import FuncAnimation

# Define the PotentialFieldPathPlanner class and other functions here

# Example usage
obstacles = [
```

```

(2, 2, 0, 1, 1, 6),
(5, 2, 0, 1, 1, 6),
(1, 5, 0, 1, 1, 6),
(5, 5, 0, 1, 1, 6),
(2, 7, 0, 1, 1, 6),
(7, 3, 0, 1, 1, 6),
(4, 1, 0, 1, 1, 6),
(1, 1, 0, 1, 1, 6),
(4, 7, 0, 1, 1, 6),
(7, 7, 0, 1, 1, 6)
]

start = (2, 4, 0)
goals = [(8, 6, 3), (1, 8, 0), (3, 1, 0)]

attractive_gains = np.linspace(1.0, 2.0, 5)
repulsive_gains = np.linspace(0.1, 2.0, 5)

best_gains, best_fitness = find_best_gains(obstacles, start, goals,
attractive_gains, repulsive_gains)
print(f"Best gains: Attractive Gain = {best_gains[0]}, Repulsive Gain =
{best_gains[1]}")
print(f"Best MSE Cost: {best_fitness}")

# Visualize the path for the best gains and the first goal
planner = PotentialFieldPathPlanner(obstacles, start, goals[0], best_gains[0],
best_gains[1])
path, cost = planner.plan_path()
visualize_path(obstacles, path, start, goals[0])

# Visualize the path for the best gains and each goal
for goal in goals:
    planner = PotentialFieldPathPlanner(obstacles, start, goal, best_gains[0],
best_gains[1])
    path, cost = planner.plan_path()
    visualize_path(obstacles, path, start, goal)

```

Visualization

The `visualize_path` function provides a 3D visualization of the path planned by the robot, including the start and goal positions and the obstacles.

Mathematical Concepts

Attractive Force

The attractive force \mathbf{F}_{att} pulls the robot towards the goal. It is typically modeled as a linear function of the distance to the goal:

\$\$

$$\mathbf{F}_{att} = k_{att} \cdot (\mathbf{q}_{goal} - \mathbf{q})$$

\$\$

where:

- k_{att} is the attractive gain.
- \mathbf{q}_{goal} is the position of the goal.
- \mathbf{q} is the current position of the robot.

Repulsive Force

The repulsive force \mathbf{F}_{rep} pushes the robot away from obstacles. It is usually modeled to have an effect only within a certain distance d_0 from the obstacle:

\$\$

$\mathbf{F}_{rep} =$

\begin{cases}

$k_{rep} \left(\frac{1}{\|\mathbf{q} - \mathbf{q}_{obs}\|} - \frac{1}{d_0} \right) \frac{1}{\|\mathbf{q} - \mathbf{q}_{obs}\|^2} \frac{\mathbf{q} - \mathbf{q}_{obs}}{\|\mathbf{q} - \mathbf{q}_{obs}\|} \quad \text{if } \|\mathbf{q} - \mathbf{q}_{obs}\| \leq d_0$

$\quad 0 \quad \text{if } \|\mathbf{q} - \mathbf{q}_{obs}\| > d_0$

\end{cases}

\$\$

where:

- k_{rep} is the repulsive gain.
- \mathbf{q}_{obs} is the position of the obstacle.
- d_0 is the influence distance of the obstacle.

Total Force

The total force \mathbf{F} acting on the robot is the sum of the attractive and repulsive forces:

\$\$

$\mathbf{F} = \mathbf{F}_{att} + \mathbf{F}_{rep}$

\$\$

Path Planning

The robot's movement is determined by the total force. At each time step, the robot's position is updated based on the force:

\$\$

$\mathbf{q}_{new} = \mathbf{q} + \Delta t \cdot \mathbf{F}$

\$\$

where Δt is the time step.

Optimization

To find the best gains k_{att} and k_{rep} , we minimize a cost function, typically the Mean Squared Error (MSE) between the planned path and the desired path:

\$\$

$$\text{MSE} = \frac{1}{N} \sum_{i=1}^N \|\mathbf{q}_i - \mathbf{q}_{goal}\|^2$$

\$\$

where N is the number of steps in the path.

Skills Demonstrated

- **Programming:** Proficient use of Python, including libraries such as NumPy and Matplotlib.
- **Robotics Engineering:** Implementation of potential field path planning, a fundamental concept in robotics navigation.
- **Optimization:** Finding the best parameters for the path planner to minimize the cost function.
- **3D Visualization:** Using Matplotlib to visualize the robot's path and obstacles in a 3D space.
